glorious green

- Complete set for safely germinating seeds
- Growing tray with transparent lid & 12 germination plugs
- 250 ml Seedbooster
- Manual in 12 languages

1

Empty the bottle of Seedbooster into the measuring cup and add 250 ml of lukewarm tap water. Stir this mixture carefully.

2

Pour the mixture into the tray, distributing the liquid evenly over the germination plugs. Wait a few minutes until the plugs have soaked up all the water.

3

Take the seeds using clean hands and plant them at a depth of 5 mm in the holes in the middle of the germination plugs.

4

Place the transparent lid on the tray. Ensure that the lid fits exactly between the two notches on the inside of the tray. This closes the growing tray completely.

5

20 - 24 °C

Place the tray in a room with a temperature of 20 - 24 °C.

6

After 1 - 5 days the seeds will start to germinate. Now take the transparent lid from the tray and place it a little skew on the tray. This creates four small openings so fresh air can reach the seedlings.

7

Make sure the seedlings get sufficient light so they can develop well. When the seedlings reach the plastic lid, the lid can be removed. As soon as the roots start growing outside the germination plug, the plants are ready to be transplanted and raised further.
